

Weekly Influenza Summary:

"Sporadic" influenza activity was reported in Arizona for the week ending on 12/09/2006 (week 49). A total of 10 cases have been reported from across four counties. No pediatric influenza-associated deaths have been reported in Arizona for the current season. The influenza-like illness rate is above the state baseline for week 48, though this value represents reports from less than 50% of Arizona's surveillance sites.

Data in this report are provisional and may change as more reports are received.

National influenza surveillance data are available at the CDC's Influenza Surveillance site (<http://www.cdc.gov/flu/weekly/fluactivity.htm>).

Influenza Activity by County:

Key:

* = Any activity reported this season

Blue = Activity reported in past three weeks

White = No activity reported in past three weeks

Influenza Cases Reported: 2006-2007 Season

County	# cases	County	# cases	County	# cases
Apache	0	Greenlee	0	Pima	4
Cochise	1	La Paz	0	Pinal	0
Coconino	1	Maricopa	4	Santa Cruz	0
Gila	0	Mohave	0	Yavapai	0
Graham	0	Navajo	0	Yuma	0

Influenza Cases Reported: Week 49

County	# cases	County	# cases	County	# cases
Apache	0	Greenlee	0	Pima	1
Cochise	0	La Paz	0	Pinal	0
Coconino	0	Maricopa	1	Santa Cruz	0
Gila	0	Mohave	0	Yavapai	0
Graham	0	Navajo	0	Yuma	0

Lab Surveillance:

Laboratories report positive influenza tests to ADHS. Of the lab-confirmed influenza reported this season, four are influenza A (two confirmed by culture or PCR) and six are influenza B (four confirmed by culture or PCR).

Ages of reported cases range from less than one year to over 65 years.

Subtyping – Culture or PCR Results:

Viral isolation, or culture, is currently the “gold standard” for diagnosis of influenza virus infections. The influenza subtype can be determined by a test called hemagglutination inhibition (HI) using viral isolates. Polymerase chain reaction (PCR) can also be used to identify influenza B and the hemagglutinin (H) component of influenza A.

Of the two culture- or PCR-confirmed influenza A cases, one is H3N2 and one is H1 by PCR. Of the four culture- or PCR-confirmed influenza B cases, one is B/Shanghai and the other three have not been subtyped.

Influenza-Like Illness (ILI) Surveillance from Sentinel Providers

The proportion of patient visits to sentinel providers for ILI in the state was 0.9% for the week ending 12/02/2006 (week 48). This value is higher than the Arizona ILI baseline (0.5%), but represents reports from less than 20% of sentinel providers for the week.

ILI is defined as a fever of at least 100°F plus either a cough or a sore throat.

Historical Arizona Influenza Activity Levels

The graph below shows the influenza activity levels reported to the CDC this season in comparison to the last season and eight previous seasons. For week 49, Arizona reported “sporadic” activity. Definitions of these reporting categories can be found at <http://www.cdc.gov/flu/weekly/fluactivity.htm>.

RSV Activity in Arizona:

Increasing respiratory syncytial virus (RSV) activity has been reported in Arizona. As of 12/09/2006, 24 lab-confirmed cases have been reported. Three new cases of RSV were reported during week 49.
